(57) **ABSTRACT**

A keyboard sled adapted to communicatively interact with a portable computer system. In one embodiment, the keyboard sled is comprised of an integral receiving portion adapted to mechanically and electronically receive a portable computer system. An interface connector is disposed within the receiving portion and adapted to provide a communicative link between the keyboard sled and a portable computer system, when a portable computer system has been inserted in the receiving portion. The keyboard sled further has at least one mounting hook disposed within the receiving portion for providing positive retention of a portable computer system when coupled with the keyboard sled. A keyboard portion also present on the keyboard sled and also coupled with the interface connector provides input keys. The keyboard sled is also comprised of an integral data storage access slot which is adapted to provide access to a data storage device receptacle of the portable computer system. The keyboard sled also adds input functionality to the portable computer system.

KEYBOARD SLED WITH ROTATING SCREEN

FIELD OF THE INVENTION

The present invention relates to portable computer systems. More particularly, the present invention provides an mechanism for receiving portable computer systems and which provides user interoperability to the portable computer system.

BACKGROUND OF THE INVENTION

Continued advancements in technology have enabled the further miniaturization of the components required to build computer systems, creating new categories of computer systems. One of the newer categories of computer systems developed has been the portable, hand held, or "palmtop" computer system, referred to as a personal digital assistant or PDA. Other examples of a palmtop computer system include electronic address books, electronic day planners, electronic schedulers and the like. Many corporations have developed and are currently marketing their individual PDAs.

A palmtop computer system is a computer that is small enough to be held in the user's hand and as such is "palm-sized." As a result, palmtops are readily carried about in the user's briefcase, purse, and in some instances, in the user's pocket. The palmtop computer, being inherently lightweight by virtue of its size, is therefore exceptionally portable and convenient.

While the continued miniaturization of computer systems enables a user to now carry in their pocket the equivalent of a computer system that once occupied an entire room, it is the miniaturization that has also reduced some of the functionality of the palmtop computer system. To support the diminutive form factor of the palmtop computer, certain functions and components normally associated with full sized computers have been reduced or eliminated.

One of the components whose functionality has been reduced is the input device or keyboard. To comply with the diminutive form factor, a full sized keyboard is not employed. A handwriting recognition system was developed to provide a way for a user to input alphabetic and numeric characters into the portable computer system. To input a numeric or alphabetic character, a user would be required to physically perform, upon a handwriting recognition pad, a specific writing stroke or a combination of writing strokes. The writing stroke is mandated by the developer of the handwriting recognition system, and as such, a portable computer system manufactured by one company may have different writing strokes than another portable computer system manufactured by a different company. Accordingly, a user would need to memorize the writing strokes for most of the alphanumeric characters, or at least have a writing stroke chart readily available to which to refer, before being able to enter data. While this attempt does provide an effective way for many users to input alphanumeric characters, it can be a somewhat slow process for others. As such, this method is not particularly well suited for a user who desires to enter substantial amounts of data.

In addition to the handwriting recognition system, as mentioned above, manufacturers also developed an alphanumeric touch screen. In this attempt to provide a way for a user to input data, a user activates a small screen that displays a graphical representation of a keyboard. Because of the small display screen utilized in the portable computer system, three separate representations, each consisting of portions of a full

2

sized keyboard are generally necessary. For example, when a user was to input text, an alphabetic keyboard portion would be used. To input a letter, a user would touch, with an approved stylus or other screen touching device, the appropriate letter displayed on the viewing screen, thereby selecting that letter, and that letter would then be displayed on the viewing screen. A user would perform the same process for each letter.

Further, when that same user needed to input numerical data, the user would switch from the alphabetic keyboard to the numerical keyboard to enter the required numbers, and then switch back to the alphabetic keyboard to continue with the inputting of alphabetic data. When punctuation such as, e.g., an exclamation point is needed, the user was required to switch to the keyboard that contained the punctuation. While this attempt also provides an effective way for many users to input alphanumeric characters, it can be a somewhat slow process for others. As such, this method is not particularly well suited for a user who desires to enter substantial amounts of data.

In another attempt, a miniature keyboard was developed which was adapted into the form factor of the portable computer system. Unfortunately, because this miniature keyboard was so small, as were the keys, it was difficult to input data. Additionally, using any more than one finger at a time was difficult, given the tiny surface on which the keys were disposed. Further, because of the miniature size of the keyboard, a user would be required to contort their wrists and arms into uncomfortable positions to input the data.

SUMMARY OF THE INVENTION

Thus, a need exists for an apparatus that is coupled to and provides a convenient and simple way for a user to input data into a portable computer system. An additional need exists for an apparatus that meets the above listed objective and which provides full sized keyboard functionality to a portable computer system. An additional need exists for an apparatus which meets the above listed objectives and which provides for proper ergonomic positioning of the keyboard relative to the user.

These and other objects and advantages of the present invention will no doubt become obvious to those of ordinary skill in the art after having read the following detailed description of the preferred embodiments which are illustrated in the various drawing figures.

The present invention provides a sled device that is adapted to be coupled with a portable computer system and adds input capability to the device. The present invention further provides, in one embodiment, an apparatus that achieves the above listed functionality and which further provides normal sized inputting functionality to a portable computer system. The present invention further provides an apparatus that has the above listed functionality, and which provides full sized keyboard functionality to a portable computer system. Further, the present invention also provides an apparatus which achieves the above listed functionality, and which further provides the apparatus in an ergonomically designed configuration, thereby decreasing the occurrence of user discomfort. More specifically, the present invention provides an apparatus that is adapted to be communicatively coupled with a portable computer system. In one embodiment, the present invention includes a keyboard sled. The keyboard sled has a receiving portion configured to receive a portable computer system that is in a landscape (horizontal) orientation. The portable computer system has a display orientation controller for controlling the orientation of the display. In the present embodiment,

3

the keyboard sled further has an interface connector disposed within the receiving portion and adapted to provide a communicative link between the keyboard sled and a portable computer system, when a portable computer system has been inserted into the receiving portion. The keyboard sled is also has a mounting hook within the receiving portion. The mounting hook is for providing positive retention of the portable computer system when coupled with the keyboard sled. The keyboard sled further has a keyboard portion coupled with the interface connector for providing input keys. In one embodiment, the keyboard portion has alphanumeric input keys. In another embodiment, the keyboard portion has numeric input keys. In present embodiment, the keyboard sled may also be configured with a wireless modem for communication functionality. In another embodiment of the present invention, the keyboard sled can be configured to provide gaming controls. The keyboard sled is has a data storage access slot disposed integral of the keyboard sled. The data storage access slot is adapted to provide access to a data storage device receptacle of the portable computer system.

BRIEF DESCRIPTION OF THE DRAWINGS

The accompanying drawings, which are incorporated in and form a part of this specification, illustrate embodiments of the invention and, together with the description, serve to explain the principles of the invention:

FIG. 1A is a block diagram of an exemplary network environment including a portable computer system, in accordance with one embodiment of the present invention.

FIG. 1B is a block diagram of a portable computer system connected to other computers and the Internet via a cradle device, in accordance with one embodiment of the present invention.

FIG. 2 is a front angled perspective view of a portable computer system configured with a removable front cover, upon which embodiments of the present invention may be practiced, in accordance with one embodiment of the present invention.

FIG. 3 is a rear angled perspective view of the portable computer system of FIG. 2.

FIG. 4 is a block diagram of the circuits and components of the portable computer system of FIG. 2, in accordance with one embodiment of the present invention.

FIG. 5 is a front angled perspective view of a keyboard receiving sled, in accordance with one embodiment of the present invention.

FIG. 6 is a front angled perspective view of a keyboard receiving sled, in accordance with another embodiment of the present invention.

FIG. 7 is a front angled perspective view of a gaming receiving sled, in accordance with one embodiment of the present invention.

FIG. 8 is a block diagram of the circuits and components of the present invention, in accordance with one embodiment of the present invention.

DETAILED DESCRIPTION

An apparatus for receiving a portable computer system is described. In the following description, for purposes of explanation, numerous specific details are set forth in order to provide a thorough understanding of the present invention. It will be obvious, however, to one skilled in the art that the present invention may be practiced without these specific

4

details. In other instances, well-known structures and devices are shown in block diagram form in order to avoid obscuring the present invention.

Exemplary Platform

The present invention is discussed primarily in the context of a portable computer system, such as a palmtop or personal digital assistant. However, it is appreciated that the present invention can be used with other types of portable electronic devices that have the capability to access some type of central device or central site, including but not limited to palmtop computer systems, pagers cellular phones, etc.

FIG. 1A is a block diagram of an exemplary network environment 50 including a portable computer system 100 in accordance with one embodiment of the present invention. Portable computer system 100 is also known as a palmtop or palm-sized computer system. In one embodiment, portable computer system 100 has the ability to transmit and receive data and information over a wireless communication interface (e.g., a radio interface). For purposes of the present application, the term "portable computer system" is not intended to be limited solely to conventional palmtop or portable computers. Instead, the term "portable computer" or "portable computer system" is also intended to include any mobile electronic device. Such mobile devices include but are not limited to pagers and paging systems, wireless and cellular telephones, electronic address books, and numerous other mobile devices which may have the ability to wirelessly communicate with a network. As such, for purposes of the present application, the terms "portable computer" and "mobile device" will be considered synonymous and will be used interchangeably.

Base station 32 can be both a transmitter and receiver base station, which can be implemented by coupling it into an existing public telephone network 34. Implemented in this manner, base station 32 enables portable computer system 100 to communicate with a proxy server computer system 36, which is coupled by wire to the existing public telephone network 34. Furthermore, proxy server computer system 36 is coupled to the Internet 52, thereby enabling portable computer system 100 to communicate with the Internet 52. When communicating with a Web site over Internet 52, protocols such as CTP (Compact Transport Protocol), WAP (Wireless Markup Protocol), and markup languages such as CML (Compact Markup Language), WML (Wireless Markup Language) which includes HDML (Handheld Device Markup Language), and XML (Extensible Markup Language) can be used by portable computer system 100 in the present embodiment.

It should be appreciated that one of the functions of proxy server 36 is to perform operations over the Internet 52 on behalf of portable computer system 100. For example, proxy server 36 has a particular Internet address and acts as a proxy device for portable computer system 100 over the Internet 52.

It should be further appreciated that other embodiments of a communications network may be utilized in accordance with the present invention. For example, a wireless connection may be made from portable computer system 100 directly to the Internet 52.

The data and information which are communicated between base station 32 and portable computer system 100 are the same type of information and data that can conventionally be transferred and received over a public telephone wire network system. Additionally, in FIG. 1A, the existing telephone network could also be a packet-based network, utilized by some conventional portable computer systems.

5

However, a wireless communication interface is utilized to communicate data and information between portable computer system **100** and base station **32**. Furthermore, nearly any wireless network can support the functionality to be disclosed herein.

FIG. **1B** illustrates another embodiment of a system **51** that can be used in conjunction with various embodiments of the present invention. System **51** comprises a host computer system **56** which can either be a desktop unit as shown, or, alternatively, can be a laptop system **58**. Optionally, one or more host computer systems can be used within system **51**. Host computer systems **58** and **56** are shown connected to a communication bus **54**, which in one embodiment can be a serial communication bus, but could be of any of a number of well known designs, e.g., a parallel bus, Ethernet Local Area Network (LAN), etc. Optionally, bus **54** can provide communication with the Internet **52** using a number of well-known protocols.

Importantly, bus **54** is also coupled to a cradle **60** for receiving and initiating communication with portable computer system **100**. Cradle **60** provides an electrical and mechanical communication interface between bus **54** (and anything coupled to bus **54**) and the computer system **100** for two-way communications. Portable computer system **100** may instead be coupled to host computer systems **56** and **58** via a wireless (radio) connection. Computer system **100** also contains a wireless infrared communication mechanism **64** for sending and receiving information from other devices. Additionally, in FIG. **1B**, the existing telephone network could also be a packet-based network, utilized by some conventional portable computer systems.

With reference to both FIGS. **1A** and **1B**, it is appreciated that portable computer system **100** can be used in a network environment combining elements of networks **50** and **51**. That is, as will be seen below, portable computer system **100** can include both a wireless infrared communication mechanism and a signal (e.g., radio) receiver/transmitter device.

FIG. **2** is a front angled perspective view of the top face of a portable computer system **100**, upon which embodiments of the present invention may be practiced. The top face **100a** contains a flat panel display screen **105** surrounded by a bezel or cover. A removable stylus **80** is disposed along the right side edge of portable computer system, but by virtue of the angle of the illustration, is not visible. The display screen **105** is a touch screen able to register contact between the screen and the tip of stylus **80**. Stylus **80** can be of nearly any material to make contact with screen **105**. The top face **100a** also contains one or more dedicated and/or programmable buttons **75** for selecting information and causing the portable computer system to implement functions. The on/off button **95** is also shown.

Still referring to FIG. **2**, it should be appreciated that in one embodiment, portable computer system **100** may be configured with a removable front cover **175**. Front cover **175** is adapted to provide protection against damage to display screen **105**. Front cover **175** may rotate as shown by the arrow, about the axis, or hinge, as shown in FIG. **2**. Also shown is communication interface connector **180**. In one embodiment of the present invention, communication interface **180** is a serial communication port, but could also alternatively be of any of a number of well-known communication standards and protocols such as, e.g., parallel, SCSI (small computer system interface), Firewire (IEEE 1394) Ethernet, USB, or a bullet type communication interface.

FIG. **3** is a rear angled perspective view of the bottom side **100B** of portable computer system **100** upon which embodiments of the present invention may be practiced. An extend-

6

ible antenna **85** is shown as is stylus **80**. Communication interface **180**, analogous to communication interface **180** of FIG. **2** is shown. Battery storage compartment door **90** and portable computer system mounting hook receiving slots **120a** and **120b** are shown. Shown is front cover **175**, analogous to front cover **175** of FIG. **2**.

Still referring to FIG. **3**, also shown is optional data storage device receptacle **140**, adapted to receive optional data storage devices such as, e.g., secure digital (SD) cards, multimedia cards (MMC), memory sticks, and the like.

FIG. **4** illustrates circuitry of portable computer system **100**. Portable computer system **100** includes an address/data bus **110** for communicating information, a central processor **101** coupled with the bus for processing information and instructions, a volatile memory **102** (e.g., random access memory, RAM) coupled with the bus **110** for storing information and instructions for the central processor **101** and a non-volatile memory **103** (e.g., read only memory, ROM) coupled with the bus **110** for storing static information and instructions for the processor **101**. Computer system **100** also includes an optional data storage device **104** (e.g., SD (secure digital) cards) coupled with the bus **110** for storing information and instructions. Device **104** can be removable. As described above, computer system **100** also contains a display device **105** coupled to the bus **110** for displaying information to the computer user.

With reference still to FIG. **4**, computer system **100** also includes a signal transmitter/receiver device **108**, which is coupled to bus **110** for providing a physical communication link between computer system **100**, and a network environment (e.g., network environments **50** and **51** of FIGS. **1A** and **1B**, respectively). As such, signal transmitter/receiver device **108** enables central processor unit **101** to communicate wirelessly with other electronic systems coupled to the network. It should be appreciated that within the present embodiment, signal transmitter/receiver device **108** is coupled to antenna **85** (FIGS. **2** and **3**) and provides the functionality to transmit and receive information over a wireless communication interface. It should be further appreciated that the present embodiment of signal transmitter/receiver device **108** is well suited to be implemented in a wide variety of ways. For example, signal transmitter/receiver device **108** could be implemented as a modem.

In one embodiment, computer system **100** includes a communication circuit **109** coupled to bus **110**. Communication circuit **109** includes an optional digital signal processor (DSP) **120** for processing data to be transmitted or data that are received via signal transmitter/receiver device **108**. Alternatively, processor **101** can perform some or all of the functions performed by DSP **120**.

Also included in computer system **100** of FIG. **4** is an optional alphanumeric input device **106** that in one implementation is a handwriting recognition pad and buttons. Alphanumeric input device **106** can communicate information and command selections to processor **101**. Computer system **100** also includes an optional cursor control or directing device (on-screen cursor control **107**) coupled to bus **110** for communicating user input information and command selections to processor **101**. In one implementation, on-screen cursor control device **107** is a touch screen device incorporated with display device **105**. On-screen cursor control device **107** is capable of registering a position on display device **105** where the stylus makes contact. Display device **105** is suitable for generating graphic images and alphanumeric characters recognizable to the user. In the preferred embodiment, display device **105** is a flat panel display.

Still referring to FIG. 4, also shown is display orientation controller **150**. Orientation controller **150** is configured to control the orientation of display screen **105**, thereby providing both portrait type (vertical) and landscape type (horizontal) viewing enablement to portable computer system **100**. In one embodiment of the present invention, orientation controller **150** is an automatic sensing controller, such that, regardless of the orientation of the display screen **105**, the controller properly orients the data. In one example, when portable computer system is oriented in a portrait mode, the data displayed is in the usual and customary vertical mode. When the computer system is oriented in a landscape mode, the data displayed is reoriented to be readable, as in a vertical mode, but with the display horizontal.

In another embodiment of the present invention, display orientation controller **150** is a switch activated type controller. In the present embodiment, a dedicated and/or programmable button **75**, (shown in FIG. 2), or a combination thereof, is/are configured to initiate reorientation of the display screen **105**. In one example, a portable computer system **100**, having viewable data, is rotated from a portrait (vertical) orientation to a landscape (horizontal) orientation. The viewable data appears in a sideways manner, analogous to a printed text page being held horizontally. A user would press programmable button(s) **75** which would activate display orientation controller **150**, and the viewable data would be reoriented so as to be easily readable in a vertical manner, although the display screen is still in a horizontal mode. If the display screen is reoriented to a vertical mode, pressing programmable button(s) **75** again would orient the viewable data to the original vertical mode.

FIG. 5 is a front angled perspective illustrated view of keyboard sled **2001**, one embodiment of the present invention. Portable computer system **100**, analogous to the portable computer system **100** of FIGS. 2 and 3 is disposed above keyboard sled **2001** and positioned to be coupled to keyboard sled **2001**. In this embodiment, portable computer system **100** is oriented in a landscape (horizontal) mode. Because of display orientation controller **150**, the data displayed on display screen **105** is easily readable.

In this embodiment of the present invention, keyboard sled **2001** is shown to include receiving portion **2000**, which is adapted to receive a portable computer system in a landscape (horizontal) orientation. Also shown is interface connector **181**, adapted to be coupled with interface connector **180** of portable computer system **100** (FIGS. 2 and 3), and configured to provide the communicative link between keyboard sled **2001** and portable computer system **100**. Also shown are mounting hooks **121a** and **121b**, which are adapted to provide retentive functionality to keyboard receiving sled **2001**. For example, when portable computer system **100** is coupled with keyboard sled **2001**, mounting hooks **121a** and **121b** are disposed such that they are insertable into mounting hook receiving slots **120a** and **120b** of FIG. 3. This provides positive retention of **100** portable computer system, thereby preventing portable computer system **100** from becoming inadvertently disengaged from keyboard receiving sled **2001**.

Still referring to FIG. 5, shown is keyboard portion **500**, which in one embodiment of the present invention, is a QWERTY type keyboard having a full complement of keys. Keyboard **500** is disposed integral with keyboard sled **2001**. It should be appreciated that because keyboard sled **2001** is configured to receive a portable computer system **100** in a landscape (horizontal) orientation, it has enabled the development of a larger sized keyboard with larger sized keys, which therefore provides for improved ergonomics.

In another embodiment of the present invention, keyboard portion **500** may be configured as a half keyboard. The components, functions and processes that comprise a half keyboard are described in detail in the following: "One-Handed Keyboard," U.S. Pat. No. 5,288,158 issued Feb. 22, 1994 by Matias, Edgar, all of which is incorporated herein by reference.

It should be further appreciated that in another embodiment of the present invention, keyboard sled **2001** may be configured with a wireless modem (see FIG. 8), such that wireless communication functionality is provided to keyboard sled **2001** and portable computer **100**. Accordingly, an antenna, indicated by dotted line **400**, for providing transceiving capabilities to keyboard sled **2001** would be included with keyboard sled **2001**. As such, because of the full sized keyboard and communication functionality contained therein, responding to electronic mail is that much simpler, quicker, and easier.

FIG. 6 shows keyboard sled **2002** in a front angled perspective view, in another embodiment of the present invention. Shown is portable computer system **100**, analogous to portable computer system **100** of FIGS. 2, 3. Portable computer system **100** is oriented in a landscape (horizontal) mode. Because of display orientation controller **150**, the data displayed on display screen **105** is easily readable.

In this embodiment of the present invention, keyboard sled **2002** is shown to include receiving portion **2000**, which is adapted to receive a portable computer system in a landscape (horizontal) orientation. Also shown is interface connector **181**, adapted to be coupled with interface connector **180** of portable computer system **100** (FIGS. 2 and 3), which provides the communicative link between keyboard sled **2002** and portable computer system **100**.

Also shown are mounting hooks **121a** and **121b**, which are adapted to provide retentive functionality to keyboard sled **2002**. For example, when portable computer system **100** is coupled with keyboard sled **2002**, mounting hooks **121a** and **121b** are disposed such that they are insertable into mounting hook receiving slots **120a** and **120b** of FIG. 3. This provides positive retention of **100** portable computer system, thereby preventing portable computer system **100** from becoming inadvertently disengaged from keyboard sled **2002**.

Still with reference to FIG. 6, in this embodiment keyboard sled **2002** is configured with a data storage access slot **150** adapted to provide access to optional data storage receptacle **140** of portable computer system **100** of FIG. 3 when coupled with keyboard sled **2002**. Data storage access slot **150** is a pass through channel which allows a user to access data storage device receptacle **140** of portable computer system **100**. By providing access slot **150**, which, in one embodiment of the present invention, is disposed upon the underneath side of keyboard sled **2002**, a user is able to insert and remove data storage devices such as, e.g., SD or MMC or memory sticks into and out of data storage device receptacle **140** of portable computer system **100** without disengaging computer system **100** from keyboard sled **2002** to which it is coupled.

Also shown in FIG. 6 are left side keyboard portion **501L** and right side keyboard portion **501R**, respectively. It should be appreciated that a full complement of keys are present, although in this embodiment, the key pad is divided into two halves. By providing a split style keyboard, a proper ergonomic position is provided to a user.

It should be further appreciated that although not shown in FIG. 6, keyboard sled **2002** could be, in another embodiment of the present invention, configured with a wireless modem

(see FIG. 8), such that wireless communication functionality is provided to keyboard sled **2002**, analogous to the communication device of FIG. 5.

FIG. 7 shows keyboard sled **2002** configured as a gaming sled **2003**, in a front angled perspective view, in another embodiment of the present invention. Shown is portable computer system **100**, analogous to portable computer system **100** of FIGS. 2 and 3. Portable computer system **100** is oriented in a landscape (horizontal) mode. Because of display orientation controller **150**, the data displayed on display screen **105** is easily readable.

In this embodiment of the present invention, gaming sled **2003** is shown to include receiving portion **2000**, which is adapted to receive a portable computer system in a landscape (horizontal) orientation. Also shown is interface connector **181**, adapted to be coupled with interface connector **180** of portable computer system **100** (FIGS. 2 and 3), which provides the communicative link between gaming sled **2003** and portable computer system **100**.

Also shown are mounting hooks **121a** and **121b**, which are adapted to provide retentive functionality to gaming sled **2003**. For example, when portable computer system **100** is coupled with gaming sled **2003**, mounting hooks **121a** and **121b** are disposed such that they are insertable into mounting hook receiving slots **120a** and **120b** of portable computer system **100** of FIG. 3. This provides positive retention of **100** portable computer system, thereby preventing portable computer system **100** from becoming inadvertently disengaged from gaming sled **2003**.

Still with reference to FIG. 7, in this embodiment gaming sled **2003** is configured with a data storage access slot **150** adapted to provide access to optional data storage receptacle **140** of portable computer system **100** of FIG. 3 when coupled with gaming sled **2003**. Data storage access slot **150** is a pass through channel which allows a user to access data storage device receptacle **140** of portable computer system **100**. By providing access slot **150**, which, in one embodiment of the present invention, is disposed upon the underneath side of gaming sled **2003**, a user is able to insert and remove data storage devices such as, e.g., SD or MMC or memory sticks into and out of data storage device receptacle **140** of portable computer system **100** without disengaging computer system **100** from gaming sled **2003** to which it is coupled. Accordingly, when games are stored within an SD (secure digital card) for example, to change from one game to another, a user would simply remove one gaming SD card and insert a new gaming SD card.

FIG. 7 also shows gaming sled **2003** having left side gaming portion **502L** and right side gaming portion **502R**. By providing a split style gaming sled, a proper ergonomic position is provided to a user. In the embodiment shown, a joystick type function knob **800** is shown as disposed upon left side gaming portion **502L**. Multiple dedicated and/or programmable gaming function buttons **801** are shown as disposed upon right side gaming portion **502R**.

It should be appreciated that multiple configurations of gaming buttons **801** is possible. In one embodiment, more than the shown number of buttons may be disposed upon gaming portions **502L** and **502R**. In another embodiment of the present invention, less than the shown number of buttons may be present. In yet another embodiment, dedicated and/or programmable gaming function buttons **801** may also be disposed upon the same side as joystick type function knob **800**. In yet another embodiment, joystick type function knob **800** could be disposed upon right side gaming portion **502R** and dedicated and/or programmable gaming buttons **801** may be disposed upon left side gaming portion **502L**. Nearly any

combination of buttons and/or knobs may be disposed on either side of gaming sled **2003**.

It should be appreciated that in another embodiment of the present invention, gaming sled **2003** may be configured with a wireless modem (see FIG. 8), such that wireless communication functionality is provided to gaming sled **2003**, analogous to the communication device of keyboard sled **2001** of FIG. 5.

It should be further appreciated that in another embodiment of the present invention, keyboard sled **2002** and gaming sled **2003** may be of a modular construction. In this embodiment of the present invention, a primary sled component having mounting hooks **121a** and **121b**, interface connector **181**, and data storage access slot is present. The primary sled component is configured to receive and be coupled with keyboard halves **501L** and **501R** of FIG. 6 and gaming halves **502L** and **502R** of FIG. 7. Accordingly, a user who is entering data via keyboard halves, **501L** and **501R**, respectively, completes the desired data inputting, and now wishes to commence game playing. The user would remove the keyboard halves, and replace them with gaming halves **502R** and **502L**, without having to disengage portable computer system **100**.

FIG. 8 is a block diagram illustration of the circuitry and components of the keyboard and gaming sleds **2001**, **2002**, and **2003** of FIGS. 5, 6 and 7, respectively, which can be implemented on and/or coupled with a system board **2004** contained therein. System **2004** includes an address/data bus **800** for communicating information, an input controller **801** coupled with the bus for processing instructions received from alphanumeric input device **802** and gaming controls **810**. In one embodiment, alphanumeric input device **802** is the keyboard **500** portion of keyboard receiving sled **2001** of FIG. 5. In another embodiment, alphanumeric input device **802** is keyboard **501L** and **501R** of keyboard receiving sled **2002** of FIG. 6.

Still referring to FIG. 8, system **2004** may also include a communication circuit **803**, for providing wired and wireless communication functionality to keyboard and gaming sleds **2001**, **2002**, and **2003**. Also included is optional power supply **805**, which is configured to provide power to sleds **2001**, **2002**, and **2003**. In one embodiment, sleds **2001**, **2002**, and **2003** are configured to operate utilizing the power supply retained within a portable computer system, which can decrease the normal operating time of the portable computer system. In another embodiment, sleds **2001**, **2002**, and **2003** are configured to operate utilizing their power supply. By providing an additional power supply, which may or may not be utilized at any given time, a user can extend the operating time of the portable computer system, such that the rate of recharging or replacing the power supply is reduced. Also shown is interface connector **181**, of FIGS. 5, 6, and 7 which is configured to be coupled with interface connector **180** of portable computer system **100**, so as to provide communication between portable computer system **100** and sleds **2001**, **2002**, and **2003**.

The foregoing descriptions of specific embodiments of the present invention have been presented for purposes of illustration and description. They are not intended to be exhaustive or to limit the invention to the precise forms disclosed, and obviously many modifications and variations are possible in light of the above teaching. The embodiments were chosen and described in order to best explain the principles of the invention and its practical application, to thereby enable others skilled in the art to best utilize the invention and various embodiments with various modifications as are suited to the

11

particular use contemplated. It is intended that the scope of the invention be defined by the Claims appended hereto and their equivalents.

What is claimed is:

1. A keyboard device to communicate with a portable computer system, the keyboard device comprising:
 - a receiving portion to receive the portable computer system;
 - an interface connector disposed within the receiving portion to provide a communicative link between the keyboard device and the portable computer system, the communicative link being established when a corresponding connector of the portable computer system is mated with the interface connector;
 - a retaining mechanism provided with the receiving portion to provide retention of portable computer system in the receiving portion of the keyboard device;
 - a keyboard coupled to the interface connector and for providing keyboard inputs;
 - a communication port to enable the keyboard device to connect to another computer system; and
 - a controller circuit to enable the keyboard inputs to be provided to the portable computer system when the communicative link is established between the keyboard device and the portable computer system.
2. The keyboard device of claim 1, wherein the receiving portion is structured to receive the portable computer system so that the interface connector mates with the corresponding connector of the portable computer system.
3. The keyboard device of claim 1, wherein the retaining mechanism is provided with the receiving portion, such that when the portable computer system is coupled to the keyboard device, the retaining mechanism is insertable in a receiving slot of the portable computer system.
4. The keyboard device of claim 1, further comprising a power supply, and wherein the keyboard device is enabled to provide power to the portable computer system when the communicative link is established between the keyboard device and the portable computer system.
5. The keyboard device of claim 1, wherein the keyboard provides a plurality of alphanumeric keys.
6. The keyboard device of claim 5, wherein a set of the plurality of alphanumeric keys is arranged in a QWERTY keyboard arrangement.
7. The keyboard device of claim 1, wherein the keyboard device further comprises a wireless communication mechanism.
8. The keyboard device of claim 7, wherein the wireless communication mechanism is Bluetooth enabled.
9. The keyboard device of claim 1, wherein the keyboard device is enabled to use a power supply of the portable computer system when the communicative link is established between the keyboard device and the portable computer system.
10. A gaming device to communicate with a portable computer system, the gaming device comprising:
 - a receiving portion to receive the portable computer system;
 - an interface connector disposed within the receiving portion to provide a communicative link between the gaming device and the portable computer system, the communicative link being established when a corresponding connector of the portable computer system is mated with the interface connector;
 - a retaining mechanism provided in the receiving portion to secure the portable computer system with the gaming device when coupled with the gaming device;

12

- a plurality of gaming control input mechanisms coupled to the interface connector and for providing game control inputs;
- a communication port to enable the gaming device to connect to another computer system; and
- a controller circuit to enable the game control inputs to be provided to the portable computer system when the communicative link is established between the gaming device and the portable computer system.
11. The gaming device of claim 10, wherein the receiving portion is structured to receive the portable computer system so that the interface connector mates with the corresponding connector of the portable computer system.
12. The gaming device of claim 10, wherein the gaming device is enabled to use a power supply of the portable computer system when the communicative link is established between the gaming device and the portable computer system.
13. The gaming device of claim 10, wherein the retaining mechanism is provided with the receiving portion, such that when the portable computer system is coupled to the gaming device, the retaining mechanism is insertable in a receiving slot of the portable computer system.
14. The gaming device of claim 10, further comprising a power supply, and wherein the gaming device is enabled to provide power to the portable computer system when the communicative link is established between the gaming device and the portable computer system.
15. The gaming device of claim 10, wherein the plurality of gaming control input mechanisms includes a joystick.
16. The gaming device of claim 10, wherein the gaming device further comprises a wireless communication mechanism.
17. The gaming device of claim 16, wherein the wireless communication mechanism is Bluetooth enabled.
18. A system comprising:
 - a) a portable computer system; and
 - b) a keyboard device comprising:
 - a receiving portion to receive the portable computer system;
 - an interface connector disposed within the receiving portion to provide a communicative link between the keyboard device and the portable computer system, the communicative link being established when a corresponding connector of the portable computer system is mated with the interface connector;
 - a retaining mechanism provided with the receiving portion to secure the portable computer system with the keyboard device when coupled with the keyboard device;
 - a keyboard coupled to the interface connector and for providing keyboard inputs;
 - a communication port to enable the keyboard device to connect to another computer system; and
 - a controller circuit to enable the keyboard inputs to be provided to the portable computer system when the communicative link is established between the keyboard device and the portable computer system.
19. The system of claim 18, wherein the receiving portion is structured to receive the portable computer system so that the interface connector mates with the corresponding connector of the portable computer system.
20. The system of claim 18, wherein the retaining mechanism is provided with the receiving portion, such that when the portable computer system is coupled to the keyboard device, the retaining mechanism is insertable into a receiving slot of the portable computer system.

21. The system of claim 18, wherein the keyboard device further comprises a power supply, and wherein the keyboard device is enabled to provide power to the portable computer system when the communicative link is established between the keyboard device and the portable computer system. 5

22. The system of claim 18, wherein the keyboard provides a plurality of alphanumeric keys.

23. The system of claim 22, wherein a set of the plurality of input keys is arranged in a QWERTY keyboard arrangement.

24. The system of claim 18, wherein the keyboard device is enabled to use a power supply of the portable computer system when the communicative link is established between the keyboard device and the portable computer system. 10

25. The system of claim 18, wherein the keyboard device further comprises a wireless communication mechanism. 15

26. The system of claim 25, wherein the wireless communication mechanism is Bluetooth enabled.
